

What made Jupyter / Python successful

- Fully Open
- Composable & Extensible libraries / uses
- Ease of getting work done
- Combined prose, code, viz, audio/video, interactivity
- Gallery of interesting Notebooks
- Serve scientific computing & education
(data science come in stored ^{reproducible} views)
- Use in knowledge sharing

Some Shepherd Architecture Goals

- Meet people where they work
 - Terminal
 - Web
 - Local application
 - Sharing on Web
- Focus on the core
 - Trust the community to extend when we don't have knowledge or capacity
- Python and JS
- Emphasis on "Don't make me think design"
- A shareable artifact

Gallery of Interesting Notebooks

- Uses in different domains
- Science, Social Sciences, For

Critical Success Factors

- Start small & scale
- Share the basic core and teach / onboard how to get work done
- Focus on ^{fully} open at its core
- European centric & serve the Global South and beyond
- Community-owned
- Core & Ecosystems Distinction

Where to start

Phase 1

Terminal

→ Open local Model

→ .py file format

→ Human first interaction

Phase 2

2

Editors or Notebooks

Visual components, interaction and saving → Open source

→ Integrates agnostic approaches (endpoints, notebooks, IDEs)

Phase 3

Fully open tooling

- provenance
- confidence (clusters, types) etc.
